User Input 1: Import Configuration
Paste your JSON or YAML configuration for the workflow nodes.

User Input 2: Authorization Group
Enter the authorized domain group for secure data access.

User Input 3: Manager Email
Enter the manager's email address for approval notifications.

Generator : Generate Workflow State
Objective: Analyze the provided workflow configuration, authorization group, and manager email to generate a comprehensive status report. Use the memory tools to retrieve and update historical latency and execution event data for the parallel nodes: Text Generator, Data Summarizer, and Insight Extractor. Assess the security permission status for the domain group and identify all pending approvals assigned to the manager email.

Output Format: Provide a structured report including live execution logs, latency trends from memory, security status details, and a list of pending approvals. Save the final report using the write to file tool and signal completion using the system objective fulfilled tool. User Input / Context: Authorization Group: **@Authorization Group**
Workflow Configuration: @ **Import Configuration**
Manager Email: @**Manager Email**

Output : Render Workflow Dashboard
Create a professional, high-fidelity monitoring dashboard for a multi-node workflow management system. The design should follow a "Technical Command Center" aesthetic—polished, data-rich, and highly structured, utilizing a dark-themed professional color palette (Deep Charcoal, Slate Blue, and vibrant accent colors like Emerald for success and Amber for pending actions).

1. Layout Organization - **Top Navigation & Security Header**: A sleek top bar displaying the application title, the current Manager’s email, and a prominent security badge indicating the "Authorized Domain Group" status. - **Parallel Node Monitor (Main Grid)**: A three-column grid layout representing the concurrent execution of the **Text Generator**, **Data Summarizer**, and **Insight Extractor**. Each column must feature: - A status indicator (Active, Completed, or Idle). - A live-scrollable log terminal with monospace text. - A latency metric display showing real-time execution speed. - **Workflow Analytics & Logs**: A section dedicated to the Monitoring/Logs node, using a table or list view to track historical execution events, system latency trends, and folder/database write permissions status (Controlled Actuation). - **Human-in-the-Loop Action Center**: A high-visibility, centered "Pending Approval" card or modal that appears when a report is queued. This must include a summary of the final report and a large, distinct 'Approve' button to trigger the final actuation.

2. Style & Design Language - **Aesthetic Goal**: Premium Technical. The interface should feel like a mission-critical enterprise tool—reliable, fast, and sophisticated. - **Color Scheme**: Use a "Midnight Tech" palette. Background: `#0f172a` (Slate 900); Card backgrounds: `#1e293b` (Slate 800); Borders: `#334155`; Accents: Cyan for data flow, Emerald for "Success", and Goldenrod for "Pending Approval". - **Typography**: Use a clean, modern sans-serif (e.g., Inter or Roboto) for the UI, and a crisp monospace (e.g., JetBrains Mono or Fira Code) for the live execution logs and terminal outputs. - **Spacing**: Maintain a high information density but utilize

generous padding within cards and clear grouping to prevent visual clutter. Use subtle shadows and 8px border radii to create a sense of depth.

3. Component Guidelines - **Status Cards**: Use micro-interactions (like subtle pulse animations) for the three parallel nodes to indicate active processing. - **Approval Interface**: The 'Approve' button should have a distinct, high-contrast glow or hover effect to draw the manager’s attention. - **Data Visuals**: Use small sparklines or progress bars to visualize latency and completion percentages for the parallel branches. - **Security Feedback**: Clearly distinguish between "Authorized" and "Restricted" states using icons (locks/shields) and semantic color coding.

4. Responsiveness Ensure a mobile-first responsive grid that stacks the three parallel nodes vertically on smaller screens while maintaining the persistent visibility of the Approval Action Center at the bottom of the viewport.
